#### Abstract

The purpose of the present paper is to find the necessary and sufficient conditions under which a generalized h -Randers change of Finsler metric becomes a projective change .We have also found a condition under which a generalized h-Randers change of Douglas space becomes a Douglas space.

Keyword: Randers change, generalized Randers change, h-vector, Finsler space, projective change.

Mathematics Subject Classification (2010): 53B40, 53C60

## 1. Introduction

Let $\mathrm{F}^{\mathrm{n}}=\left(\mathrm{M}^{\mathrm{n}}, \mathrm{L}\right)$ be a n -dimensional Finsler space on a differentiable manifold $\mathrm{M}^{\mathrm{n}}$, equipped with the fundamental function $\mathrm{L}(\mathrm{x}, \mathrm{y})$.Various changes of Finsler metric have been studied recently papers [2],[3],[4],[5],[6] and [7].

The necessary and sufficient conditions for these changes to be projective have been obtained. The conditions for Douglas spaces with the changed metric to remain Douglas spaces have been found out.

The generalized h-Randers change of Finsler metric is given by

$$
\begin{equation*}
\bar{L}(\mathrm{x}, \mathrm{y})=\left(L^{m}+\beta^{m}\right)^{1 / m} \text { where } \beta(\mathrm{x}, \mathrm{y})=\mathrm{b}_{\mathrm{i}}(\mathrm{x}, \mathrm{y}) \mathrm{y}^{\mathrm{i}} \tag{1.1}
\end{equation*}
$$

and $\mathrm{b}_{\mathrm{i}}(\mathrm{x}, \mathrm{y})$ in the transformation (1.1) is an h-vector, so that $\frac{\partial b_{i}}{\partial y^{j}}$ is proportional to the angular metric tensor $\mathrm{h}_{\mathrm{ij}}$.
Let

$$
\begin{equation*}
\frac{\partial b_{i}}{\partial y^{j}}=\rho h_{i j} \tag{1.2}
\end{equation*}
$$

where $\rho$ is any scalar function of $\mathrm{x}, \mathrm{y}$ and $\mathrm{h}_{\mathrm{ij}}=\mathrm{g}_{\mathrm{ij}}-l_{i} l_{j}$.
It has been show by Shukla, Pandey and Joshi in [8] that

$$
\begin{equation*}
\dot{\partial}_{\mathrm{k}} \rho=-\frac{\rho}{L} \quad l_{\mathrm{k}} \quad, \text { for } \mathrm{n}>2, \quad \text { where } \quad \dot{\partial}_{\mathrm{k}} \equiv \frac{\partial}{\partial y^{k}} \tag{1.3}
\end{equation*}
$$

We shall use the equation (1.3) without quoting it in the present paper.
Let $\beta=\mathrm{b}_{\mathrm{i}}(\mathrm{x}, \mathrm{y}) \mathrm{y}^{\mathrm{i}}$ be defined throughout the manifold $\mathrm{M}^{\mathrm{n}}$. Then $L \rightarrow\left(L^{m}+\beta^{m}\right)^{1 / m}$ is called generalized h-Randers change of Finsler metric. If we write
$\bar{L}=\left(L^{m}+\beta^{m}\right)^{1 / m}$ and $\bar{F}^{\mathrm{n}}=\left(\mathrm{M}^{\mathrm{n}}, \bar{L}\right)$ then the Finsler space $\bar{F}^{\mathrm{n}}$ is said to beobtained from $\mathrm{F}^{\mathrm{n}}$ by a generalized h- Randers change of Finsler metric. The quantities corresponding to $\bar{F}{ }^{n}$ will be denoted by putting bar over those quantities.

The fundamental quantities of $\mathrm{F}^{\mathrm{n}}$ are given by
$g_{i j}=\frac{1}{2} \frac{\partial^{2} L^{2}}{\partial y i \partial y^{j}}, \quad l_{i}=\frac{\partial L}{\partial y^{i}}$ and $\mathrm{h}_{\mathrm{ij}}=\mathrm{L} \frac{\partial^{2} L}{\partial y^{i} \partial y^{j}}=g_{i j-} l_{i} l_{j}$
We shall denote the partial derivatives with respect to $x^{i}$ and $y^{i}$ by $\partial_{i}$ and $\dot{\partial}_{l}$ respectively and write
$L_{i}=\dot{\partial}_{l} L, L_{i j}=\dot{\partial}_{l} \dot{\partial}_{j} L, L_{i j k}=\dot{\partial}_{l} \dot{\partial}_{j} \dot{\partial}_{k} L$.
Then $L_{i}=l_{i}, \quad L^{-1} h_{i j}=L_{i j}$
The geodesics of $\mathrm{F}^{\mathrm{n}}$ are given by the system of differential equations
$\frac{d^{2} x^{i}}{d s^{2}}+2 G^{i}\left(x, \frac{d x}{d s}\right)=0$,
where $\mathrm{G}^{\mathrm{i}}(\mathrm{x}, \mathrm{y})$ are positively homogeneous of degree two and are given by
${ }_{2} G^{i}=g^{i j}\left(y^{r} \dot{\partial}_{J} \partial_{r} F-\partial_{j} F\right), \quad F=\frac{L^{2}}{2}$
where $g^{i j}$ are the inverse of $g_{i j}$.
Berwald connection $B \Gamma=\left(G_{j k}^{i}, G_{j}^{i}, 0\right)$ of Finsler space is given by [10]

$$
G_{j}^{i}=\frac{\partial G^{i}}{\partial y^{j}}, \quad G_{j k}^{i}=\frac{\partial G_{j}^{i}}{\partial y^{k}}
$$

The Cartan's connection $C \Gamma=\left(F_{j k}^{i}, G_{j}^{i}, G_{j k}^{i}\right)$ is constructed from L with the help of following axioms [10]:
(1) Cartan's connection $\mathrm{C} \Gamma$ is v-metrical.
(2) Cartan's connection $\mathrm{C} \Gamma$ is h-metrical.
(3) The $\mathrm{h}(\mathrm{v})$-torsion tensor field S of Cartan's connection vanishes.
(4) The $\mathrm{h}(\mathrm{h})$-torsion tensor field T of Cartan's connection vanishes.
(5) The deflection tensor field D of Cartan's connection vanishes.

The h - and v - covariant derivatives with respect to Cartan's connection are denoted by $\mathrm{I}_{\mathrm{k}}$ and $\mathrm{l}_{\mathrm{k}}$ respectively. It is clear that the $h$-covariant derivative of $L$ with respect to $\mathrm{B} \Gamma$ and $\mathrm{C} \Gamma$ is the same and vanishes identically .Furthermore, the h-covariant derivatives of $\mathrm{L}_{\mathrm{i}} \mathrm{L}_{\mathrm{ij}}$ with respect to $\mathrm{C} \Gamma$ are also zero .We shall write

$$
2 r_{i j}=b_{i \mid j}+b_{j \mid i} \quad, \quad 2 s_{i j}=b_{i \mid j}-b_{j \mid i}
$$

## 2. Difference Tensor of Generalized h-Randers Change

The generalized h-Randers change of Finsler metric $L$ is given by (1.1)

$$
\begin{equation*}
\bar{G}^{i}=G^{i}+D^{i} . \tag{2.1}
\end{equation*}
$$

Then $\bar{G}_{j}^{i}=G_{j}^{i}+D_{j}^{i}$ and $\bar{G}_{j k}^{i}=G_{j k}^{i}+D_{j k}^{i}$, were $D_{j}^{i}=\dot{\partial}_{j} D^{i}$ and $D_{j k}^{i}=\dot{\partial_{k}} D_{j}^{i}$.
The tensors $D^{i}, D_{j}^{i}$ and $D_{j k}^{i}$ are positively homogeneous in $y^{i}$ of degree two, one and zero respectively.
To find $\mathrm{D}^{\mathrm{i}}$, we deal with equation $\mathrm{L}_{\mathrm{ijIk}}=0[9]$, i.e.,

$$
\begin{equation*}
\partial_{k} L_{i j}-L_{i j k} G_{k}^{r}-L_{r j} F_{i k}^{r}-L_{i r} F_{j k}^{r}=0 . \tag{2.2}
\end{equation*}
$$

Since $\dot{\partial}_{l} \beta=b_{i}$, from (1.1), we have
(a) $\overline{L_{i}}=p L_{i}+q b_{i}$,
where $p=\frac{L^{m-1}}{\left(L^{m}+\beta^{m}\right)^{(m-1)} / m}$ and $q=\frac{\beta^{m-1}}{\left(L^{m}+\beta^{m}\right)^{(m-1) / m}}$
(b) $\bar{L}_{i j}=\mu L_{i j}+\gamma\left\{\beta^{2} L_{i} L_{j}-L \beta\left(L_{i} b_{j}+L_{j} b_{i}\right)+L^{2} b_{i} b_{j}\right\}$,
where $\mu=\frac{L^{m-1}+\rho L \beta^{m-1}}{\left(L^{m}+\beta^{m}\right)^{(m-1) / m}} \quad$ and $\gamma=\frac{(m-1)(L \beta)^{m-2}}{\left(L^{m}+\beta^{m}\right)^{(2 m-1) / m}}$,
(c) $\partial_{j} \bar{L}_{i}=\beta \gamma\left(\beta L_{i}-L b_{i}\right) \partial_{j} L+L \gamma\left(L b_{i}-\beta L_{i}\right) \partial_{j} \beta+p \partial_{j} L_{i}+q \partial_{j} b_{i}$,
(d) $\partial_{k} \bar{L}_{i j}=\mu \partial_{k} L_{i j}+\left\{\left[\rho q+\beta \gamma\left(\beta-\rho L^{2}\right)\right] L_{i j}+\eta L_{i} L_{j}-\xi\left(L_{i} b_{j}+L_{j} b_{i}\right)+\varphi b_{i} b_{j}\right\} \partial_{k} L+\left\{L \gamma\left(\rho L^{2}-\right.\right.$

$$
\left.\beta) L_{i j}-\xi L_{i} L_{j}+\varphi\left(L_{i} b_{j}+L_{j} b_{i}\right)+\delta b_{i} b_{j}\right\} \partial_{k} \beta+\beta \gamma\left(\beta L_{j}-L b_{j}\right) \partial_{k} L_{i}+\beta \gamma\left(\beta L_{i}-L b_{i}\right) \partial_{k} L_{j}+
$$

$$
L \gamma\left(L b_{j}-\beta L_{j}\right) \partial_{k} b_{i}+L \gamma\left(L b_{i}-\beta L_{i}\right) \partial_{k} b_{j}+L q L_{i j} \partial_{k} \rho,
$$

where

$$
\begin{aligned}
\eta & =(m-1) \beta^{m} L^{m-3}\left[(m-2) \beta^{m}-(m+1) L^{m}\right]\left(L^{m}+\beta^{m}\right)^{(1-3 m)} / m \\
\xi & =\beta(m-1)(L \beta)^{m-2}\left[m\left(\beta^{m}-L^{m}\right)-\beta^{m}\right]\left(L^{m}+\beta^{m}\right)^{(1-3 m)} / m \\
\varphi & =L(m-1)(L \beta)^{m-2}\left[m\left(\beta^{m}-L^{m}\right)+L^{m}\right]\left(L^{m}+\beta^{m}\right)^{(1-3 m)} / m \\
\delta & =(m-1) L^{m} \beta^{m-3}\left[(m-2) L^{m}-(m+1) \beta^{m}\right]\left(L^{m}+\beta^{m}\right)^{(1-3 m)} / m
\end{aligned}
$$

(e) $\bar{L}_{i j k}=\mu L_{i j k}+\beta \gamma\left(\beta-\rho L^{2}\right)\left(L_{i} L_{j k}+L_{j} L_{i k}+L_{k} L_{i j}\right)-L \gamma\left(\beta-\rho L^{2}\right)\left(L_{i} L_{j k}+L_{j} L_{i k}+L_{k} L_{i j}\right)-$ $\xi\left(L_{i} L_{j} b_{k}+L_{i} L_{k} b_{j}+L_{j} L_{k} b_{i}\right)+\varphi\left(L_{i} b_{j} b_{k}+L_{j} b_{i} b_{k}+L_{k} b_{i} b_{j}\right)+\eta L_{i} L_{j} L_{k}+\delta b_{i} b_{j} b_{k}$.

Since $\bar{L}_{i j \mid k}=0$ in $\bar{F}^{n}$,after using (2.1), we have

$$
\begin{equation*}
\partial_{k} \bar{L}_{i j}-\bar{L}_{i j r} \bar{G}_{k}^{r}-\bar{L}_{j r} \bar{F}_{i k}^{r}-\bar{L}_{i r} \bar{F}_{j k}^{r}=0 \tag{2.4}
\end{equation*}
$$

Substituting in the above equation the values of $\partial_{k} \bar{L}_{i j,} \bar{L}_{i r}$ and $\bar{L}_{i j k}$ from (2.3) in (2.4) and then contracting the equation thus obtained with $\mathrm{y}^{\mathrm{k}}$, we get

$$
\begin{equation*}
2 \bar{L}_{i j r} D^{r}+\bar{L}_{j r} D_{i}^{r}+\bar{L}_{i r} D_{j}^{r}-L \gamma\left(L b_{j}-\beta L \rho\right)\left(r_{i 0}+s_{i 0}\right)-L \gamma\left(L b_{i}-\beta L_{i}\right)\left(r_{j 0}+s_{j 0}\right)- \tag{2.5}
\end{equation*}
$$

$\left\{\gamma L\left(\rho L^{2}-\beta\right) L_{i j}-\xi L_{i} L_{j}+\varphi\left(L_{i} b_{j}+L_{j} b_{i}\right)+\delta b_{i} b_{j}\right\} r_{00}-L q \rho_{0} L_{i j}-2 \rho q L_{r} L_{i j} G^{r}=0$,
where ' 0 ' stands for contraction with $\mathrm{y}^{\mathrm{k}}$, viz., $r_{j 0}=r_{j k} y^{k}, r_{00}=r_{i j} y^{i} y^{j}, \rho_{0}=\rho_{k} y^{k}$ and we have used the fact that $D_{j k}^{i} y^{k}={ }^{c} D_{j k}^{i} y^{k}=D_{j}^{i} \quad[9]$.

Next, we deal with $\bar{L}_{i \mid j}=0$, that is,
(2.6) $\partial_{j} \bar{L}_{i}-\bar{L}_{i r} \bar{G}_{j}^{r}-\bar{L}_{r} \bar{F}_{i j}^{r}=0$.

Putting the values of $\partial_{j} \bar{L}_{i}, \bar{L}_{i r}$ and $\bar{L}_{r}$ from (2.3) in (2.6), we get,

$$
q b_{i \mid j}=\left[\mu L_{i r}+\gamma\left\{\beta^{2} L_{i} L_{r}-L \beta\left(L_{i} b_{r}+L_{r} b_{i}\right)+L^{2} b_{i} b_{r}\right\}\right] D_{j}^{r}+\left(p L_{r}+q b_{r}\right)^{c} D_{i j}^{r}+L \gamma\left(\beta L_{i}-\right.
$$ $\left.L b_{i}\right)\left(r_{0 j}+s_{0 j}\right)$,

which, after using $2 r_{i j}=b_{i \mid j}+b_{j \mid i}$ and $2 s_{i j}=b_{i \mid j}-b_{j \mid i}$,
gives

$$
\begin{gather*}
2 \mathrm{q} r_{i j}=\left[\mu L_{i r}+\gamma\left\{\beta^{2} L_{i} L_{r}-L \beta\left(L_{i} b_{r}+L_{r} b_{i}\right)+L^{2} b_{i} b_{r}\right\}\right] D_{j}^{r}+\left[\mu L_{j r}+\gamma\left\{\beta^{2} L_{j} L_{r}-\right.\right.  \tag{2.7}\\
\left.\left.L \beta\left(L_{j} b_{r}+L_{r} b_{j}\right)+L^{2} b_{j} b_{r}\right\}\right] D_{i}^{r}+2\left(p L_{r}+\right.
\end{gather*}
$$

$$
\left.q b_{r}\right)^{c} D_{i j}^{r}+L \gamma\left(\beta L_{i}-L b_{i}\right)\left(r_{0 j}+s_{0 j}\right)+L \gamma\left(\beta L_{j}-L b_{j}\right)\left(r_{i 0}+s_{i 0}\right)
$$

$$
\begin{equation*}
2 q s_{i j}=\left[\mu L_{i r}+\gamma\left\{\beta^{2} L_{i} L_{r}-L \beta\left(L_{i} b_{r}+L_{r} b_{i}\right)+L^{2} b_{i} b_{r}\right\}\right] D_{j}^{r}-\left[\mu L_{j r}+\gamma\left\{\beta^{2} L_{j} L_{r}-L \beta\left(L_{j} b_{r}+\right.\right.\right. \tag{2.8}
\end{equation*}
$$

$$
\left.\left.\left.L_{r} b_{j}\right)+L^{2} b_{j} b_{r}\right\}\right] D_{i}^{r}+L \gamma\left(\beta L_{i}-L b_{i}\right)\left(r_{0 j}+s_{0 j}\right)-L \gamma\left(\beta L_{j}-L b_{j}\right)\left(r_{i 0}+s_{i 0}\right)
$$

Subtracting (2.7) from (2.5) and contracting the resulting equation with $\mathrm{y}^{\mathrm{i}}$, we get
(2.9) $-2\left[\mu L_{j r}+\gamma\left\{\beta^{2} L_{j} L_{r}-L \beta\left(L_{j} b_{r}+L_{r} b_{j}\right)+L^{2} b_{j} b_{r}\right\}\right] D^{r}+L \gamma\left(L b_{j}-\beta L_{j}\right) r_{00}+2 q r_{0 j}=2 \bar{L}_{r} D_{j}^{r}$

Contracting (2.9) with $\mathrm{y}^{\mathrm{j}}$, we get
(2.10) $\quad\left(p L_{r}+q b_{r}\right) D^{r}=\frac{1}{2} q r_{00}$

Subtracting (2.8) from (2.5) and contracting the resulting equation with $\mathrm{y}^{\mathrm{i}}$, we get
(2.11) $\left[\mu L_{i r}+\beta \gamma L_{i} L_{j}-\beta L \gamma\left(L_{i} b_{r}+L_{r} b_{i}\right)+L^{2} \gamma b_{i} b_{r}\right] D^{r}=q s_{i 0}+\frac{L \gamma}{2}\left(L b_{i}-\beta L_{i}\right) r_{00}$.

In view of $L L_{i r}=g_{i r}-L_{i} L_{r}$, equation (2.11) can be written as

$$
\begin{equation*}
\frac{\mu}{L} \mathrm{~g}_{\mathrm{ir}} \mathrm{D}^{\mathrm{r}}+\left\{\left(\beta^{2} \gamma-\frac{p}{L}-\rho q\right) L_{i}-\beta L \gamma b_{i}\right\} L_{r} D^{r}+L \gamma\left(L b_{i}-\beta L_{i}\right) b_{r} D^{r}=q s_{i 0}+\frac{1}{2} L \gamma\left(L b_{i}-\right. \tag{2.12}
\end{equation*}
$$ $\left.\beta L_{i}\right) r_{00}$.

Contracting (2.12) by $b^{i}=g^{i j} b_{j}$, we get

$$
\begin{equation*}
-2 \beta\left(L^{3} \gamma \Delta+\mu\right) L_{r} D^{r}+2 L\left(L^{3} \gamma \Delta+\mu\right) b_{r} D^{r}=L^{2}\left(2 q s_{0}+L^{2} \gamma \Delta r_{00}\right) \tag{2.13}
\end{equation*}
$$

where $\Delta=b^{2}-\frac{\beta^{2}}{L^{2}}$
The equations (2.10) and (2.13) are algebraic equations in $L_{r} D^{r}$ and $b_{r} D^{r}$, whose solution is given by
(2.14) $L_{r} D^{r}=\frac{L q\left(\mu r_{00}-2 L q s_{0}\right)}{2 \bar{L}\left(L^{3} \Delta \gamma+\mu\right)}$ and

$$
\begin{equation*}
b_{r} D^{r}=\frac{2 L^{2} p q s_{0}+\left\{L^{3} \gamma \bar{L} \Delta+\beta q \mu\right\} r_{00}}{\bar{L}\left(L^{3} \gamma \Delta+\mu\right)} \tag{2.15}
\end{equation*}
$$

Contracting (2.12) by $g^{i j}$ and putting the values of $L_{r} D^{r}$, and $b_{r} D^{r}$, we get

$$
\begin{equation*}
D^{i}=\frac{\mu r_{00}-2 L q s_{0}}{2 \mu\left(L^{3} \gamma \Delta+\mu\right)}\left[L^{3} \gamma b^{i}+\bar{L}^{-1}\{\mu q-\bar{L} \beta \gamma\} y^{i}\right]+\frac{L q}{\mu} s_{0}^{i}, \tag{2.16}
\end{equation*}
$$

where $l^{i}=y^{i} L^{-1}$.
Proposition (2.1): The difference tensor $D^{i}=\bar{G}^{i}-G^{i}$ of generalized h-Randers change of Finsler metric is given by (2.16).

## 3. Projective Change of Finsler Metric

The Finsler space $\bar{F}^{n}$ is said to be projective to Finsler space $F^{n}$ if every geodesic of $\mathrm{F}^{\mathrm{n}}$ is transformed to a geodesic of $\bar{F}^{n}$. It is well known that the change $L \rightarrow \bar{L}$ is projective if $\bar{G}^{i}=G^{i}+$ $P(x, y) y^{i}$, where $\mathrm{P}(\mathrm{x}, \mathrm{y})$ is a homogeneous scalar function of degree one in $\mathrm{y}^{\mathrm{i}}$, called projective factor [11].

Thus from (2.1) it follow that $L \rightarrow \bar{L}$ is projective iff $D^{i}=P y^{i}$. Now we consider that the generalized h-Randers change $L \rightarrow \bar{L}=\left(L^{m}+\beta^{m}\right)^{1 / m}$ is projective.Then from equation (2.16), we have

$$
\begin{equation*}
P y^{i}=\frac{\mu r_{00}-2 L q s_{0}}{2 \mu\left(L^{3} \gamma \Delta+\mu\right)}\left[L^{3} \gamma b^{i}+\bar{L}^{-1}\{\mu q-\bar{L} \beta L \gamma\} y^{i}\right]+\frac{L q}{\mu} s_{0}^{i} . \tag{3.1}
\end{equation*}
$$

Contracting (3.1) with $y_{i}\left(=g_{i j} y^{j}\right)$ and using the fact that $s_{0}^{i} y_{i}=0$ and $y_{i} y^{i}=L^{2}$, we get
(3.2) $P=\frac{q \mu r_{00}-2 L q s_{0}}{2 \bar{L}\left(L^{3} \gamma \Delta+\mu\right)} \quad$.

Putting the value of P from (3.2) in (3.1), we get
(3.3) $\frac{L \gamma\left\{\mu r_{00}-2 L q s_{0}\right\}}{2 \mu\left(L^{3} \gamma \Delta+\mu\right)}\left(\beta y^{i}-L^{2} b^{i}\right)=\frac{L q}{\mu} s_{0}^{i}$,

Transvecting (3.3) by $b_{i}$, we get

$$
\begin{equation*}
r_{00}=\frac{-2 q s_{0}}{L^{2} \gamma \Delta} . \tag{3.4}
\end{equation*}
$$

Substituting the value of $r_{00}$ from (3.4) in (3.2), we get

$$
\begin{equation*}
P=\frac{-q^{2} s_{0}}{\bar{L} L^{2} \gamma \Delta} . \tag{3.5}
\end{equation*}
$$

Substituting the value of $r_{00}$ from (3.4) in (3.3), we get

$$
\begin{equation*}
s_{0}^{i}=\left(b^{i}-\frac{\beta}{L^{2}} y^{i}\right) \frac{s_{0}}{\Delta} . \tag{3.6}
\end{equation*}
$$

The equations (3.4) and (3.6) give the necessary condition under which a generalized h -Randers change becomes a projective change.

Conversely, if condition (3.4) and (3.6) are satisfied, then putting these conditions in (2.16), we get
$D^{i}=\frac{-q^{2} s_{0}}{L^{2} \bar{L} \gamma \Delta} y^{i}, \quad$ i.e. $D^{i}=P y^{i}$.
Thus $\bar{F}^{n}$ is projective to $F^{n}$.
Theorem 3.1: The generalized $h$-Randers change of Finsler metric is projective iff (3.4) and (3.6) hold good; the projective factor P is given by (3.5).

## 4. Douglas Space

The Finsler space $\mathrm{F}^{\mathrm{n}}$ is called a Douglas space $\operatorname{iff} G^{i} y^{j}-G^{j} y^{i}$ is homogeneous polynomial of degree three in $y^{i}[12]$. We shall write $h p(r)$ to denote a homogeneous polynomial in $y^{i}$ of degree $r$.If we write $B^{i j}=D^{i} y^{j}-D^{j} y^{i}$, then from (2.16), we get

$$
\begin{equation*}
B^{i j}=\frac{\left(\mu r_{00}-2 L q s_{0}\right) L^{3} \gamma}{2 \mu\left(L^{3} \gamma \Delta+\mu\right)}\left(b^{i} y^{j}-b^{j} y^{i}\right)+\frac{L q}{\mu}\left(s_{0}^{i} y^{j}-s_{0}^{j} y^{i}\right) . \tag{4.1}
\end{equation*}
$$

If a Douglas space is transformed to a Douglas space by a generalized h-Randers change (2.1) then $B^{i j}$ must be hp (3) and vice-versa.

Theorem: The generalized h-Randers change of Douglas space is a Douglas space iff $B^{i j}$ given by (4.1) is $h p(3)$.
